beautyCaRe System

Regenerative radio frequency

INDIBA has combined all the experience gained over 25 years with the unique patented technology to attain maximum efficacy in beauty treatments. The regenerative results of the beautyCaRe System are highly effective in maintaining younger skin. It is capable of revitalising skin cell activity by playing a positive role in its evolution and reducing the effects of the passage of time.

Treatments & benefits

Cellulite

The INDIBA System is effective against cellulite, whether applied to localised areas or as a more general treatment. The number of sessions will depend on the treatment. To achieve optimum results, it is recommendable to use INDIBA's Anti-cellulite Gel.

Stretch marks

With the INDIBA System, a firming and toning effect is achieved.

Skin flaps

The INDIBA capacitive method increases blood circulation, achieving improvements in just a few sessions. It is important to also treat the area around the skin flap to achieve better results.

Recent scars

In the case of recent scars, treatment should begin as soon as it is advisable, to ensure that the sutures are not damaged, by applying the electrode to the area around the scar which promotes more effective healing. The number of sessions will vary according to the size and location and whether or not the scar is inflamed or infected.

Old scars

Although direct application to recent scars must be avoided, in the case of old scars the scar itself can be treated, as well as the surrounding areas. An average of 10 to 40 sessions is required to achieve effective results. The number of applications will vary according to the age of the scar.

Under-eye bags / dark circles

The INDIBA treatment firms the skin of the eye contour and helps reduce bags and dark circles under the eyes with a maximum of 15 to 20 ten-minute sessions, which should be performed as often as possible.

Double chin

The INDIBA System simultaneously reduces and firms the chin area, as well as reducing localised fat. The number of sessions will vary according to the size of the area to be treated.

Sagging skin and wrinkles

The INDIBA treatment is an effective way of treating sagging skin and face wrinkles, as it causes vasodilation which in turn increases blood and lymphatic circulation, thereby helping to provide the cells with the nutrients and oxygen that they need. This revitalises the skin and reduces any irregularities in just three sessions.

Post-liposuction

Liposuction is an aggressive treatment that causes internal trauma and reduces the body's defences. These effects, as well as any skin sagging remaining after the intervention, may be corrected by using the INDIBA System. The duration and frequency of the treatment will depend on the extent of the liposuction.

Breast firming

With the INDIBA System, it is possible to achieve firmer breasts. It is advisable to treat the entire surrounding area consistently, as well as the nipple and strap area, where treatment should be thorough as this is an important factor in achieving a greater degree of firming.

Nasogenian fold

The INDIBA System provides a restorative treatment for the nasogenian fold. In just a few sessions it will achieve a smoothing effect of the nasogenian lines, benefiting the skin structure and enhancing circulation and cell metabolism in the lip area.

By raising the internal temperature of the area being treated, **INDIBA's beautyCaRe System** attains greater efficacy, safety and speed in a wide range of beauty treatments.
